

Creating Shadows In MagiCut 6

MagiCut 6 does not have built in shadow functions so manual methods are needed

Simple Offset Shadow

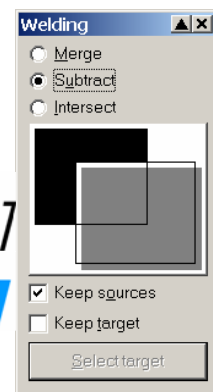

Type text or draw/scan for a shape.
Duplicate the text and colour differently.

Place one over the other and move using the “Shift and Arrow keys” so the effect is correct.

For Garment graphics simply cut the text twice once in each colour, press the lower one then the top colour. This is needed because the size shifts after the first press.

For Signage you can subtract the top from the bottom item using the welding tools with “Keep source” then apply.

Offset Shadow
Offset Shadow

The shadow part on its own can provide effective visuals as well.
